

Medical Image Analysis Report

Patient Name: Aadarsh

Age: 22 years

Gender: Male

Scan Type: MRI

Date: 2025-04-13 22:24:53

Analysis Results

Diagnosis: meningioma

Confidence: 100.0

Clinical Assessment

Meningioma detected - requires regular monitoring. May need surgical intervention if symptoms develop or tumor shows growth.

Follow-up MRI scans recommended every 6-12 months.

Follow-up Actions:

- Follow-up MRI in 3-6 months
- Monitor for new or worsening symptoms
- Regular neurosurgical evaluation

AI-Generated Suggestion

1. **AI Analysis Summary:** The MRI scan analysis strongly suggests the presence of a meningioma (100% confidence) in patient Aadarsh (22, Male). Further evaluation is crucial to confirm this finding and determine the appropriate management strategy. 2. **Recommended Next Steps:** * Immediate consultation with a neurologist or neurosurgeon is strongly advised to review the MRI results and patient history. * Obtain a tissue biopsy for definitive diagnosis and tumor grading, guiding treatment decisions. * Discuss potential treatment options, which may include observation, surgical resection, or radiation therapy, based on the tumor size, location, and patient's overall health.
